1 WEBSITE PURPOSE

PNG Digital Skills Hub is a three-page educational demonstration designed to help beginners in Papua New Guinea explore practical digital skills. The website lets visitors review a learning pathway, compare introductory courses and practise submitting an enquiry. Assessment 4 builds directly on the HTML5 structure developed for Assessment 2 and the responsive CSS3 layouts completed for Assessment 3.

2 TARGET AUDIENCE

The intended audience includes students, office staff and small-business owners interested in spreadsheets, reporting and basic web-page development. Typical tasks are finding a suitable topic, comparing expected practice outputs and completing a clearly labelled enquiry with fictional details.

3 MAIN WEBSITE FEATURES

The Home, Courses and Contact / Enquiry pages use semantic HTML5 and consistent navigation. The site includes course cards, a comparison table, an accessible learning-path graphic and a substantial practice form. CSS custom properties, Flexbox, Grid and media queries support mobile, tablet and desktop layouts. Accessibility provisions include a skip link, logical headings, alternative text, labelled controls, fieldsets and visible keyboard focus.

4 JAVASCRIPT FUNCTIONALITY

Assessment 4 adds two working JavaScript features. First, the Courses page supports live keyword filtering: matching cards remain visible, a result count updates, an unmatched search displays feedback, and Reset restores all three courses. Second, the Contact page provides a live enquiry-message character counter and extra validation that rejects whitespace-only or otherwise insufficient messages. Valid practice enquiries continue through the existing HTML GET process; no real enrolment or email is generated.

5 TESTING AND EVIDENCE

I tested keyword matches, no-result feedback and search reset, together with the form counter, whitespace rejection and a valid practice submission. The A4 functional record and screenshots document these checks. Earlier responsive testing covered 375, 768 and 1440 pixels, and the A4 search layout was checked at tablet width. A challenge was learning that HTML minimum-length checks can accept spaces; I learned to combine HTML constraints

with JavaScript checks for meaningful text and clearer feedback. Final checks in a second browser, current HTML/CSS validation and the live GitHub Pages deployment should be documented before submission.

6 LIMITATIONS AND IMPROVEMENTS

This remains a fictional service without a database, payment system, email delivery or real course registration. Because the demonstration form uses GET, practice values appear in the URL; real personal information must not be entered. Future improvements could include secure server-side processing, better confirmation feedback and externally maintained course data.

7 AI USE DECLARATION

I used ChatGPT for assessment interpretation, JavaScript examples, CSS integration, troubleshooting, testing guidance and documentation. I reviewed and implemented the changes in Visual Studio Code, tested their core behaviour locally and recorded development through Git commits. Additional details of AI assistance should be retained in the updated AI-USE-DECLARATION.md.
